Mr. Kishan Jain, Director, Goldmedal Electricals

Smart home devices have become an integral part of our digitally connected world. While these highly innovative devices have transformed our way of life in many ways, they sometimes come with their fair share of risks. One of the major challenges faced by manufacturers is to provide steps to defend these devices from cyberattacks. Here are a few steps that I feel most people can take to protect and safeguard their smart devices from malicious cyber intruders.

- 1. Choose your devices smartly**

The first step in buying smart appliances should be to carry out necessary market research on various manufacturing brands regarding their safety aspect. It is critical to the safety of your devices and home that you evaluate the security protection and privacy features offered by various brands. It's safer if they provide regular firmware updates for better performance and continuous protection. The product should always be bought from authorized resellers of the brand for genuine and authentic products.
